# Seminar III: R/Bioconductor

**August-December 2009**

Leonardo Collado Torres

Bachelor in Genomic Sciences (LCG),
UNAM, Cuernavaca, Mexico

lcollado@lcg.unam.mx

http://www.lcg.unam.mx/~lcollado/

August 21, 2009

**Assistants:** Alejandro Reyes areyes@lcg.unam.mx, José Reyes jreyes@lcg.unam.mx and Víctor Moreno jmoreno@lcg.unam.mx

**Note:** Questions through the forum please. Those who are not from the sixth LCG generation send us an email so we can register you on the forum.

**Abstract**

Expected solutions to the first set of exercises.

## 1 Review

1. Why does the following expression show a warning? This is part of what rule?

```
> c(2, 3) + c(4, 5, 7)

> "Because the 2nd vector's length is not a multiple of the first one"

[1] "Because the 2nd vector's length is not a multiple of the first one"
```

```
> "and viceversa. Its due to the recycling rule."

[1] "and viceversa. Its due to the recycling rule."
```

2. For all the prime numbers between 1 and 10, calculate its square root. What is the sum, median and mean?

```
> prime <- c(2, 3, 5, 7)
> sqrt(prime)

[1] 1.414214 1.732051 2.236068 2.645751

> sum(prime)

[1] 17

> sum(sqrt(prime))

[1] 8.028084

> median(prime)

[1] 4

> median(sqrt(prime))

[1] 1.984059

> mean(prime)

[1] 4.25

> mean(sqrt(prime))

[1] 2.007021
```

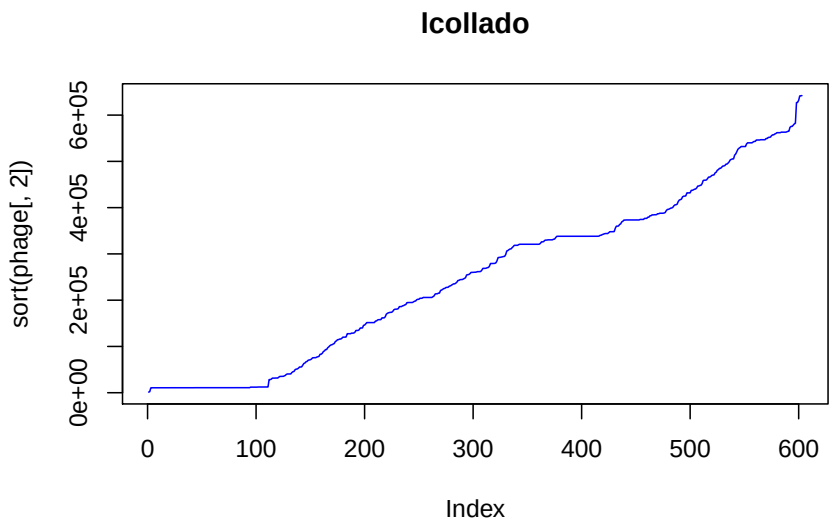
# 2 Plots

- Read the following file into R: `ftp://ftp.ebi.ac.uk/pub/databases/genome_reviews/gr2species_phage.txt`[1] and make the following plots with your username on the title. Check whether using a log10 scale on the $y$ axis helps.

```
> phage <- read.delim(file.path("ftp://ftp.ebi.ac.uk/pub/databases/genome_re
+     header = F)
```

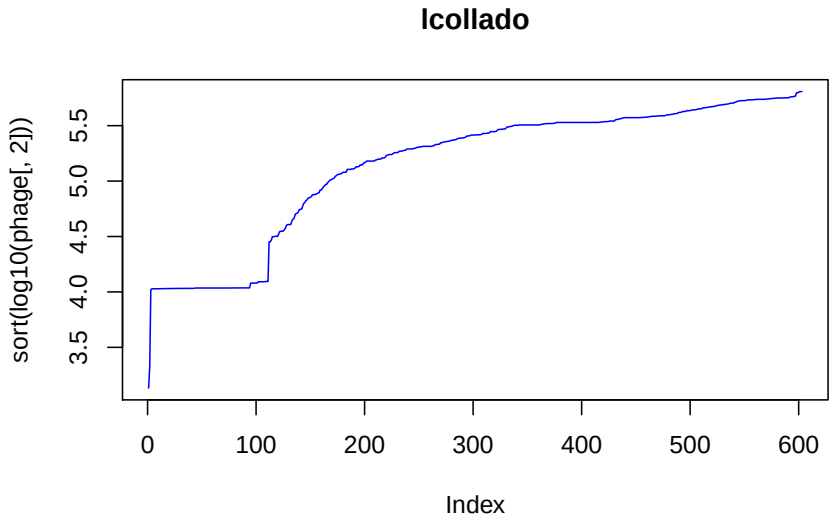
1. Sort the genome sizes (column 2) and plot them in a line with increasing values.

```
> plot(sort(phage[, 2]), type = "l",
+     col = "blue", main = "lcollado")
```



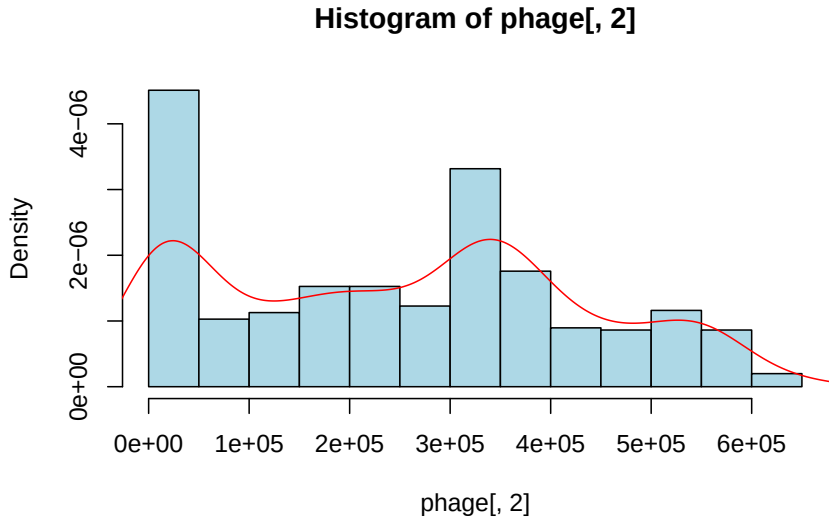
```
> plot(sort(log10(phage[, 2])), type = "l",
+     col = "blue", main = "lcollado")
> print("You can say that using log10 does help on this case")
[1] "You can say that using log10 does help on this case"
```

[1] Look for the useful function for this case



2. Plot a histogram with a density line for the same data.

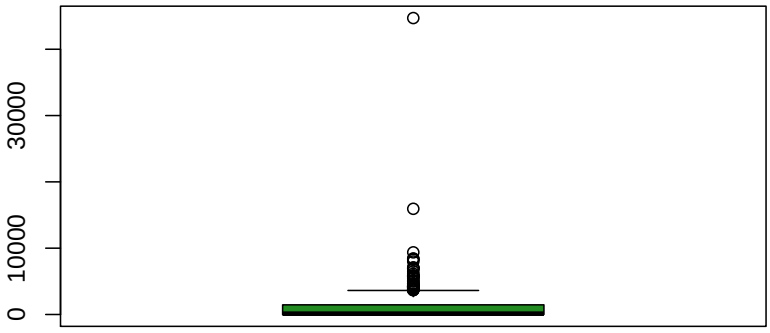
```
> hist(phage[, 2], col = "light blue",
+     prob = T)
> lines(density(phage[, 2]), col = "red")
```



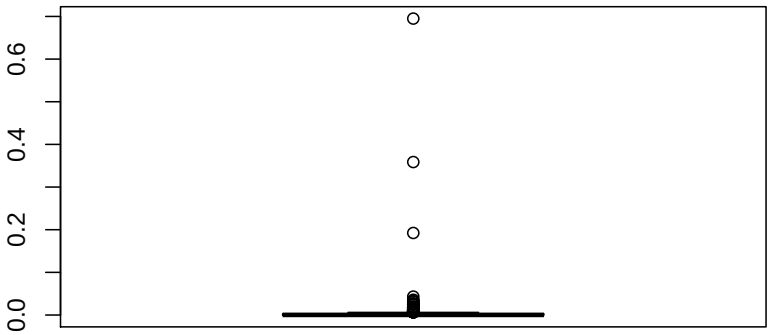
3. Plot a boxplot for the differences between contigous sorted genomes. Meaning, 2nd smallest - smallest, 3rd smallest - 2nd smallest, etc.[2]

[2] You might want to use `apropos` searching for diff...

```
> contig <- diff(sort(phage[, 2]))
> boxplot(contig, col = "forest green")
```

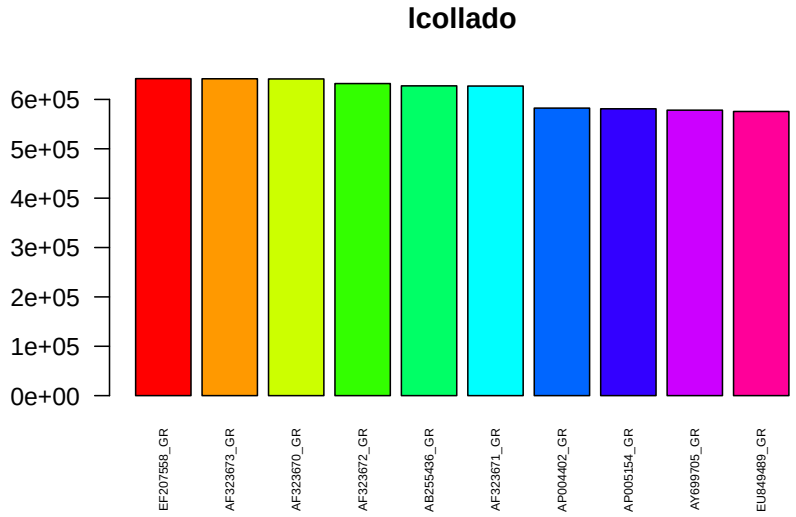


```
> contig <- diff(sort(log10(phage[,
+     2])))
> boxplot(contig, col = "forest green")
> print("Boxplot without log10 was more useful")
[1] "Boxplot without log10 was more useful"
```



4. Make a barplot showing the 10 biggest genomes. Include the names[3] on the $x$ axis and every bar has to have a different color and/or density.[4]

```
> top <- sort(phage[, 2], decreasing = T)[1:10]
> names <- NULL
> for (i in 1:10) {
+     names <- c(names, phage[which(phage[,
+         2] == top[i]), 1])
+ }
> barplot(top, col = rainbow(10),
+     names.arg = phage[names, 1],
+     cex.names = 0.5, las = 2, main = "lcollado")
```

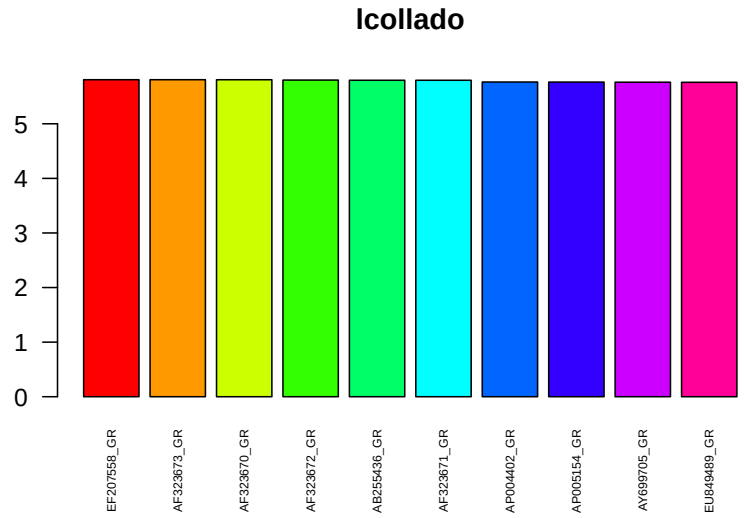


```
> barplot(log10(top), col = rainbow(10),
+     names.arg = phage[names, 1],
+     cex.names = 0.5, las = 2, main = "lcollado")
> print("Using log10 has almost no effect")
```

```
[1] "Using log10 has almost no effect"
```

[3] They have to be redable

[4] The `which` function might be useful.



# 3 Apply functions

1. What is the mean genome size for every type of replicon (column 4)? You have an atomic vector and a factor so use ...

```
> tapply(phage[, 2], phage[, 4],
+     mean)

Chromosome  Segment L  Segment M
  253726.3   106813.8   106813.8
 Segment S
  106813.8
```

2. Create a matrix `mat` with 10 rows and 10 columns and 100 random uniform values from 1 to 10. Create your own function and apply it to every row so that every row will now sum 1 in your new matrix `mat2`.

```
> mat <- matrix(runif(100, 1, 10),
+     10, 10)
> mat2 <- t(sapply(1:10, function(x) {
+     mat[x, ]/sum(mat[x, ])
+ }))
> apply(mat2, 1, sum)

 [1] 1 1 1 1 1 1 1 1 1 1
```

3. Using the same matrix `mat`, make the matrix `mat3` with row sums equal to 1 using built in `R` matrix functions. `mat2` and `mat3` should be the same.

```
> mat3 <- mat/rowSums(mat)
> rowSums(mat3)

 [1] 1 1 1 1 1 1 1 1 1 1
```
